aggregate output of the old cracking plant.

- 4. Production and shipment: The refinery is chiefly to produce aviation gasoline. The shipments of arriving crude oil and outgoing finished product amounted to about 10 oil trains per day with about 30 to 40 tank cars, or a total of nearly 16,000 to 17,000 tons.
- Permanent service in the plant in three 8-hour shifts. No information on the total number of laborers.

25X1 Comment:

According to previous information and available records there are numerous refineries on the perimeter of Gorki (56020'N/44000'E), such as the Neftegas refinery, the old and new plant "26 Commissars of Baku" and the two lubricant-oil refinery plants of Varinsky and Burnakovski. The largest plant is the Neftegas refinery with a yearly capacity of over one million tons. The others are minor plants with an aggregate annual capacity of about 700,000 tons. The cracking capacity of the Neftegas and "26 Commissars of Baku" was, up to now, estimated at about 900,000 tons per year. The refinery of Neftegas previously also produced high-grade gasolines, chiefly aviation gasoline. Judging from the definite statements by sources the whole refining plant they observed must have a working capacity of at least two million tons per year. (See the figures on arr vals and shipments of crude oil and finished product). Considering this and the stated location, only the Neftegas refinery can be referred to unless all refineries mentioned up to now were united on the same works area as appears probable. The Neftegas refinery is in Gorki-Sormovo, 2 km south of the Volga River, southeast of the rasnoye Sormovo plant. One source expressly states the name of the plant reported by him to be Neftegas, but gives a different location of the works (not west, but east of the town district). As, according to this, the extension of the cracking installations has allegedly doubted the previous capacity, this statement would also
